

electrostatic spray painting

Electrostatic painting is the cleanest and most efficient method of spray painting and perfect for updating worn, dull, and colour-dated metal surfaces. The process delivers a highly durable coating and hard-wearing surface in a flat or gloss finish. Since no air pressure is used for atomisation, there is no blast of uncontrolled overspray and surrounding areas only need to be minimally masked.

how it works

Paint is finely atomised through a gun into an electrically-charged spray. The paint is electrostatically pulled to the item to be painted, depositing almost all the paint onto the surface.

where is it used

Metal surfaces such as gates, fences, handrails, wrought iron gates, pool fences, balustrades, aluminium window frames, garage and roller doors, balcony railings, lift doors, mechanical equipment, and office furniture.

benefits

By improving paint transfer efficiency, electrostatic spraying lowers paint application costs and reduces volatile organic compounds (VOCs) emissions.

ABOUT US

We are Dulux-accredited strata specialist painters with more than sixteen years of experience. We pride ourselves on providing value for money, delivering superior workmanship, and exceptional results.
